* Complete list of updates:

<https://activemq.apache.org/components/artemis/download/release-notes-2.38>.
0

I would like to highlight these improvements:

- WebSocket compression is now supported. This compression can be used transparently for AMQP, STOMP, or MQTT when communication is over WebSockets.
- The ActiveMQServerMessagePlugin now has a messageMoved() callback.
- Core bridge configuration now supports client-id which will make it much easier to identify bridge connections on remote brokers.
- The consumer CLI command now supports consuming messages "forever."
- The authentication & authorization caches now have detailed debug logging.
- .
- There have been a handful of updates to broker management including:
 - The documentation has been improved with more examples for Jolokia and a new sub-section on management method option syntax.
 - It is now possible to pass empty "options" to the management methods that accept them.
 - The management methods which return paged results can now return all the results together by specifying -1 for either the page or the pageSize.
 - The management method option syntax now supports the NOT_EQUALS operator for greater flexibility with filtering results of management operations.
 - Configuration for diverts created via management can now be done via JSON.

As usual it contains a handful of bug fixes, other improvements, and dependency upgrades.

Many thanks to all those who contributed to this release!

Justin
