If the sender is invoking `Message.setJMSCorrelationID(String)` [1] that should be mapped onto the STOMP message using "correlation-id" (and vice versa). Again, using message ID is not recommended. You should be using correlation ID as that is what it was designed for.

Justin

Subject: Re: [Artemis] Passing message userID into STOMP

To: users@activemq.apache.org

Content-Type: text/plain; charset="UTF-8"

Content-Transfer-Encoding: quoted-printable

Given the mentions of JMS and AMQP I would presume that
qpuid-jms-client is being used. It will populate the JMSMessageID
header itself during send (unless configured not to) as per the JMS
requirements the field is set by provider-on-send.

./CAF+kE_RDXQjAZ5_3CA1VqmBiA_b5_ZWPBiNOG25jDu2WAhBsmQ@mail.gmail.com.mbx.txt
Tue Nov 12 15:14:59 2024 5

Message.setJMSMessageID() (and most other header setters like it) is exclusively for the use of JMS implementations for handling other vendors message objects, it is not for applications to use to set a MessageID on a sent message (if you try, the value will be overwritten on send with the provider-populated value).

Artemis handles STOMP messages internally using its Core protocol message objects, so it is presumably converting the AMQP message into a Core message on the way to the STOMP client. Qpid JMS uses a string-based message-id field in the underlying AMQP message by default. Core messages require a UUID message id, and so I expect it is generating a new one at that conversion point. Qpid JMS can be configured to use a pure UUID as the underlying AMQP message-id field, setting URI option `jms.messageIDPolicy.messageIDType=3DUUID`. Though JMSMessageID values must be prefixed with "ID:" so the client will synthesize that locally for JMSMessageID, meaning you could still then find that the JMSCorrelationID string you get back on the response lacks that "ID:" prefix (since the Core JMS client would normally add that to getJMSMessageID...but you are using a STOMP client).

In fact, ignore all that, as I see the broker is generating a specific formatted message-id for the STOMP messages. So you simply can't get the original AMQP message-id on the STOMP receiver.

Your most compatible route in JMS terms would be using the JMSCorrelationID field to correlate your messages, setting the JMSCorrelationID value on the request message before sending, getting that value as the correlation-id on the receiver and setting that value on the response message before replying, which the requester can retrieve from JMSCorrelationID again on the response.

As I see others have said already whilst I got interrupted during typing this reply :)

Robbie

Subject: Re: [Artemis] Passing message userID into STOMP
To: users@activemq.apache.org
Content-Type: multipart/alternative; boundary="000000000000c68652062394f53a"

--000000000000c68652062394f53a
Content-Type: text/plain; charset="UTF-8"
Content-Transfer-Encoding: quoted-printable

I see, so message ID is not really meant to be used as identifier by client
apps.

We will try setting JMSCorellationId on sender, if thats not gonna work
will probably redefine request-response mapper

Thank you all for clarification!

=D1=87=D1=82, 3 =D0=BE=D0=BA=D1=82. 2024=E2=80=AF=D0=B3. =D0=B2 18:47, Robb=

Hi, Justin!

Sender sends message into request queue and expects response message in response queue, with response's JMSCorellationId header being set to message ID that was sent (and could not be read by responder app). Sender (java app) originally was not explicitly specifying message ID, not really sure if it was set by library used or by the broker

Calling msg.setJMSMessageId(msgId) with some manually generated value did reflect on userID property of the message, however it still could not be read by responder app via STOMP, unless msg.putStringProperty('some-header-name', msgId) was called

As a solution for now we settled on manually putting message ID into string properties

=D1=87=D1=82, 3 =D0=BE=D0=BA=D1=82. 2024=E2=80=AF=D0=B3. =D0=B2 17:13, Just= in Bertram <jbertram@apache.org>:

The JMS specification prohibits you from using the setJMSMessageID
value; From the API docs

"This method is for use by JMS providers only to set this field when a
message is sent. This message cannot be used by clients to configure the
message ID. This method is public to allow a JMS provider to set this
field when sending a message whose implementation is not its own."

Tue Nov 12 15:14:59 2024 15

The most reliable way to ensure you have a stable message header to act on is to set you own value as cross protocol conversions that occur do not guarantee that the JMS message ID will be converted and reflected they way you want it to be.

As far as i know library that sender team uses automatically maps request
with response, they just need to set up response handler class.
Setting own unique id and mapping request with response would require
reimplementing library classes, not really sure if that's an ideal approach

=D1=87=D1=82, 3 =D0=BE=D0=BA=D1=82. 2024=E2=80=AF=D0=B3. =D0=B2 18:04, =D0=

Can you clarify your use-case and how the message ID is being set on the client sending the message?

Typically the message ID is set by the client implementation or by the broker and it can also change in some circumstances so it's not particularly meaningful to the messaging application. Generally speaking we recommend folks set their own unique ID if they're wanting to track messages.

Justin

Subject: [Artemis] Passing message userID into STOMP

To: users@activemq.apache.org

Content-Type: multipart/alternative; boundary="000000000000ec978006238d56b6"

--000000000000ec978006238d56b6

Content-Type: text/plain; charset="UTF-8"

Hi, we ran into an issue when receiving messages via STOMP protocol.
Message was sent by java application using JMS Serializer via AMQP protocol,
resulting in message id being stored in userID message property. When
receiving this message via STOMP, the value of userID was not present in
any header, unless the sender app manually generates an id for the message
and passes it into some custom-named header.
Could not find any related info on this property in the archive.
Maybe it is possible to add a STOMP configuration flag, similar to
stompEnableMessageId (stompEnableUserId e.g.), that would control if a
message's userID value is being passed into STOMP headers?

artemis version 2.37.0
